

## ABSTRACT

A user interface is disclosed which may take a data stream, or file having  
5 hyperlinks or functional text embedded therein. The CPU of the user interface may  
select distinct colors for each hyperlink so that such links are distinguishable. The  
color selection may be made so that each link has a button that has a matching  
color for at least one hyperlink. The user interface associates a button having a color  
with a hyperlink having the same color, such that when the button is actuated,  
10 programmed execution of the function associated with the hyperlink occurs. Thus a  
mapping of button, to color, to hyperlink, to function may be established.
